Although many tumors of the upper respiratory tract are squamous cell carcinomas, the varied tissues of this region can give rise to a bewildering array of neoplasms. This text reviews the interpretation of biopsies of neoplasms and neoplasm-like entities arising in the head and neck region, including the ear. It will discuss both neoplastic and non-neoplastic pathology to help make the correct diagnosis and guide patient management.

- NEW 30% new 4-color images
- NEW Addition of chapters to include boney lesions and odontogenic lesions.
- NEW Revision of all chapters based on current understanding, especially with HPV-related tumors
- Over 400 color images
- Will address many of the problems faced by pathologists when dealing with these biopsies
- Will concentrate specifically on the upper aerodigestive tract
