Colorectal cancer is a major cause of morbidity and mortality, particularly in the developed world. Risk factors for colorectal cancer are on the rise in many countries; populations are aging, and obesity and diabetes are increasing. National screening programs are helping to detect cancer while it is still curable; however, colorectal cancer remains the third leading cause of cancer deaths in the USA and options are still limited for those with more advanced disease. Research into diagnosis and optimum treatment of the disease is progressing rapidly, with new advances reported every day.

Colorectal Cancer presents reviews, analysis and commentary on all aspects of colorectal cancer.

- Risk factors and prevention
- Hereditary nonpolyposis colorectal cancer and other hereditary conditions
- Biomarkers for screening
- Colonoscopy and sigmoidoscopy for screening and diagnosis
- Surgery & radiation therapy
- Optimum chemotherapy regimes to maximize efficacy and minimize side effects
- Monoclonal antibodies
- Multimodality treatment
- Prospects for new treatments, such as vaccines
- Treatment of metastases
- Follow-up care for colorectal cancer survivors
